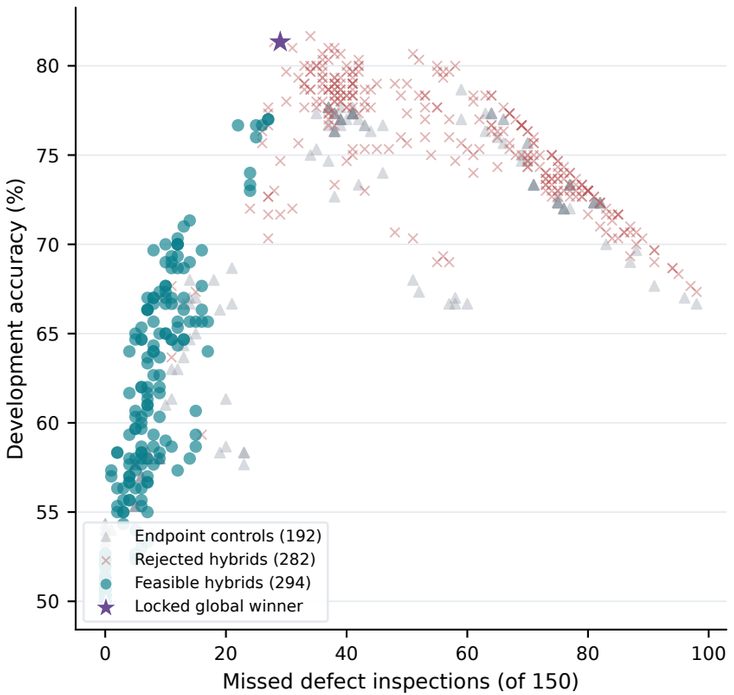
SAFAL: development search and locked image verification

Five development-exposed categories · 100 verification images · 3 support draws · k=4 + 4 normal calibration images

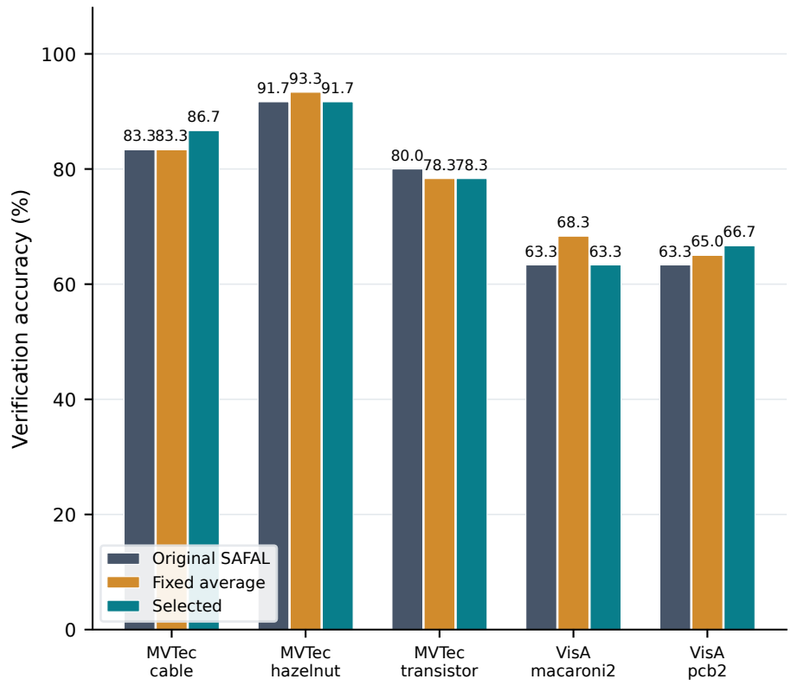
The conditional accuracy interval versus fixed averaging includes zero; an accuracy improvement is not established.

a Development search: 768 settings

Points overlap; development estimates follow selection.

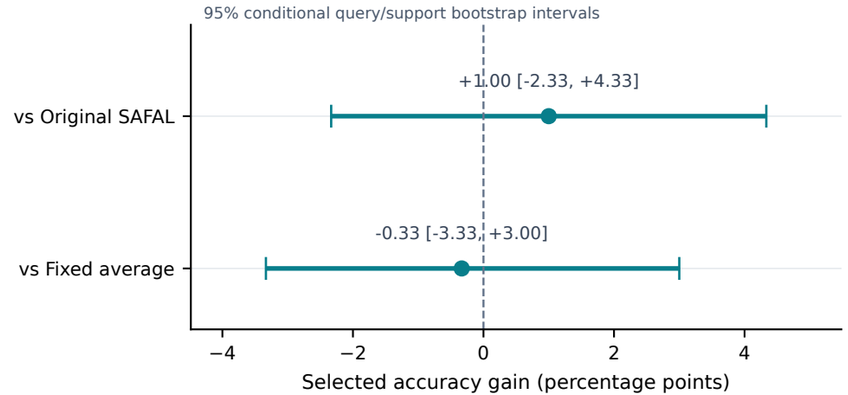


b Verification in five seen categories



c Paired gain and detection transitions

95% conditional query/support bootstrap intervals



Comparator	Detected→missed	Missed→detected
Original SAFAL	0 cases 0 images	7 cases 7 images
Fixed average	3 cases 3 images	3 cases 3 images

Cases repeat across draws; lost/restored image sets may overlap.

Development labels selected one global recipe. Verification uses unused known-history image IDs within the same categories; it is not a pristine category holdout.
Repeated inspections are dependent. Intervals are conditional on sampled categories and observed query/support units. No source-error probability head is applied.
